

10: Bonus Features

10.1: Cross-platform Accessibility

US: As a user, I would like to use the website on other platforms/devices than the website on my PC. I would like to open website on my phone or tablet, and it looks well organized. Even better, it would be great to have an app on my phone or tablet to quickly access the condo management system instead of having to type and search for it on the search engine.

Steps:

- 1- Open website on a browser on the device
- 2- Website should resize and shift its appearance a bit to follow the structure of the device (small differences between on thin phone, medium-size screen like tablets and big screens like pc)
- 3- To facilitate also, you can skip step 2 and continue with step 3. Download our app on the App store for apple devices or play store for android devices.
- 4- Open newly downloaded app and sign in
- 5- You are set to go! You should be able to receive all messages and notifications, and you can navigate freely as if you had to website open on a browser.

App running on iPad

App running on Mac

App running on iPhone

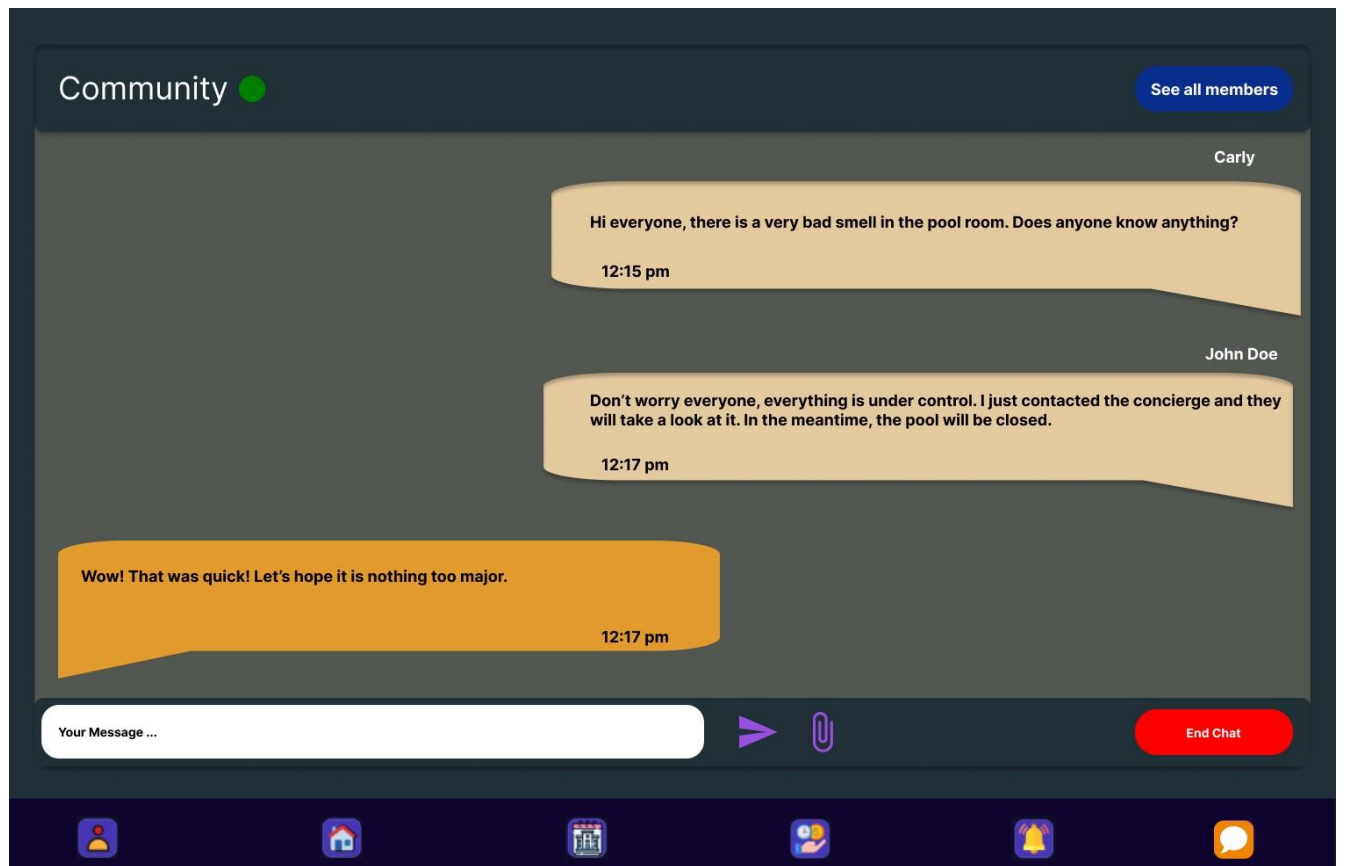

10.2: Multilingual

US: As a user, I would like to be able to navigate through the website/app in a comfortable language. I do not want to be restricted to work in the English language only, it would be great if I can navigate through my mother tongue. For example, a user, originally from Brazil, downloads, creates an account, and logs in. The website is in the English language by default, he should be able to change the language to Portuguese, if it is available, since English is his second language, and he would not be able to understand everything in English. It would be much easier and quicker to navigate through his/her 's preferred language.

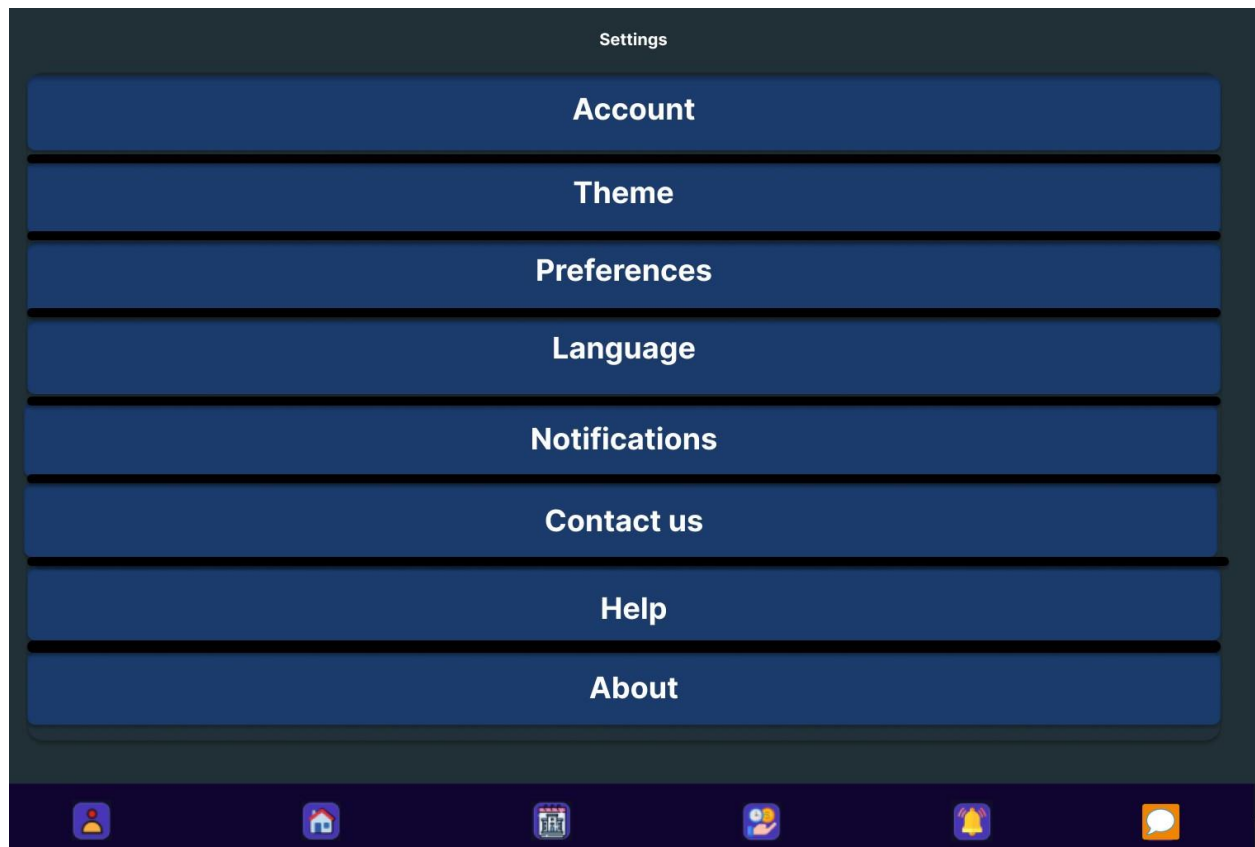

Steps:

- 1- Click on Settings button in the Menu found in the Home Page
- 2- Click on "Language", a section in the Settings' component list
- 3- Change the current language by either typing the name of the preferred language or click on the dropdown button at the end of the input field to give you a list of all available languages and click on the preferred one.
- 4- Click on "Submit" button to save changes
- 5- System Language should be updated, and user can navigate through the system in the selected language

****note that messages from other users will not change into the preferred language, whatever users type in, it will be sent/received as is. The change in language in the demos underneath are just a representation.**

Current (and default) language of the system is English (user perspective)

The Language Setting is found in the Settings Menu

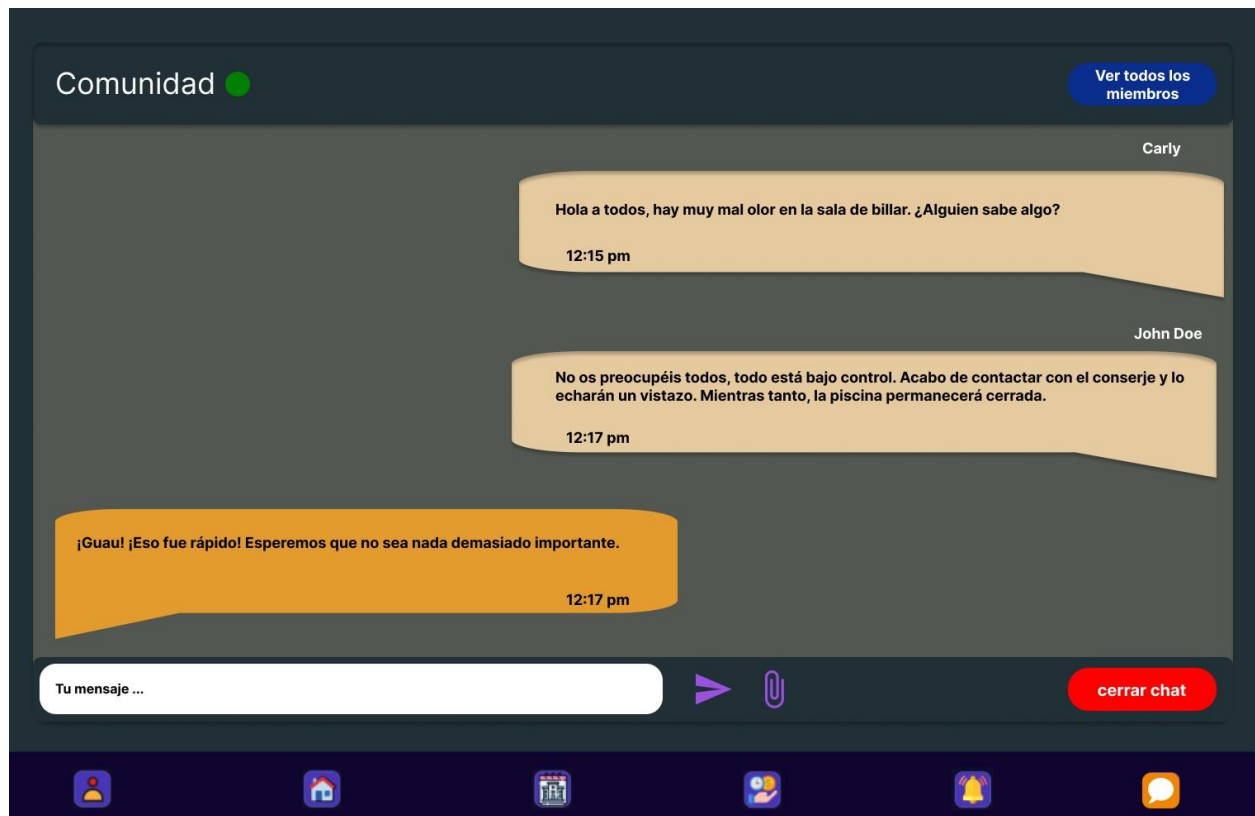

Language

System Language

Spanish

Update

Changing the Language of the System to Spanish in the Language page

Updated System Language to Spanish (user perspective)

10.3: User Login Using Various Accounts Like Gmail, SSO, etc.

US: As I user, I would like to link my email whether it is Gmail, yahoo, outlook, etc. with my account. This would facilitate a lot of things and add some security to my account. I would be able to change my password if ever needed or receive notifications there too in case I do not have the app on my phone.

Steps: While creating an account, we ask the user to add an email address to complete the registration. This feature was handled in passed sprints.
